

ABSTRACT

An object of the present invention is to provide an e-mail editing device having excellent operability, in particular, an e-mail editing device capable of switching and displaying related e-mails. A display processor simultaneously displays a message editing screen for displaying an edition mail and a mail reference screen for displaying a reference mail for reference. A reference processor copies an object in the reference mail to a temporary storage. An editor pastes the object to an edition mail. A mail search portion searches for an e-mail in a memory on the basis of the reference mail. When a user performs a mail switching operation, the reference mail is switched to a searched e-mail for display.
